Initial Visit & Treatment Plan

Amount

Oral Evaluation, Prophylaxis, Fluoride treatment, Facility Visit

This initial visit includes a comprehensive oral evaluation, prophylaxis/debridement, fluoride treatment, and facility visit. Following this initial evaluation, a thorough assessment of the condition of the mouth and treatment plan of recommended services listed below will be conducted and discussed with the responsible party.

\$235 total
for 1st visit

Description of Services

Comprehensive Oral Evaluation

A comprehensive oral evaluation includes: oral cancer screening, charting of existing and restorations, evaluation of decay, screening for infection and periodontal disease (which includes periodontal pocket measurements and mobility.)

\$40

Prophylaxis/Debridement

A prophylaxis is teeth cleaning in a relatively healthy mouth. It includes the removal of plaque and tartar on teeth. This is done with a Cavitron or power instrument and redefined with hand instruments. It is usually finished with a polishing to remove stain.

\$120

Root Planning

This is a non-surgical approach for the treatment of periodontal disease. Large amounts of bacteria in the mouth will cause infection. Early infection will have little or no symptoms, however, symptoms of more serious infection include bad breath, gum discomfort & pain, tooth sensitivity, and loose teeth. Signs of infection include, bleeding, exudate, pocket depths of over 4 millimeters, and the accumulation of tartar & plaque (bacteria) below the gumline. Root Planning is a non-surgical option to reduce such infection. It is necessary to spend more time to clean the tartar, bacteria, and infected tissue. This can be done with a topical anesthetic and is normally done with the sections or quadrants on multiple days for patient comfort.

\$200 per
quadrant

Periodontal Maintenance

After the root planning procedure, it is necessary to keep the bacterial plaque at a minimum with periodontal cleanings every 3-4 months. A prescription strength antibacterial mouth wash is applied during the Cavitron scaling. Hand-scaling and polish finish the procedure.

\$150

Application of Fluoride

An application of Fluoride is recommended to prevent cavities and reduce teeth sensitivity. Fluoride is extremely important for adults with dry mouth. Seniors are especially susceptible to this due to the many prescriptions they take, which can dry the oral tissues. The combination of medications and naturally occurring loss of saliva with aging will help to cause cavities and gum infections.

\$25

Facility Visit

A facility visit charge is assessed to cover the costs of transportation, set-up and use of the facility.

\$50
